Machine Design Data Khurmi

Machine design is a fundamental aspect of mechanical engineering that involves creating machines and components that are efficient, reliable, and safe. Among the many resources available for students and professionals, the book "Machine Design" by R. S. Khurmi and J. K. Gupta is considered one of the most comprehensive and authoritative texts. This book provides extensive machine design data, formulas, tables, and guidelines that are essential for designing various machine components. In this article, we delve into the key machine design data from Khurmi's book, organized into essential sections to serve as a valuable reference for engineers, students, and designers.

Material Properties and Allowable Stresses

Understanding material properties and allowable stresses is crucial for selecting appropriate materials and ensuring safety and durability in machine components.

Common Materials and Their Properties

- **Carbon Steel:** Widely used due to its strength and affordability. Typical tensile strength ranges from 350 to 700 MPa.
- **Cast Iron:** Good castability and machinability. Tensile strength varies from 80 to 300 MPa.
- **Bronze and Brass:** Used for bearings and fittings. Tensile strength about 200 to 400 MPa.
- **Aluminum Alloys:** Light and corrosion-resistant. Tensile strength around 70 to 500 MPa.

Allowable Stresses (from Khurmi Data)

Allowable stresses depend on the material, type of loading, and service conditions:

- For Mild Steel:

- Working stress in tension: 100 MPa
- Working stress in compression: 100 MPa
- Shear stress: 40 MPa

- For Cast Iron:

- Working stress in tension: 20 MPa
- Working stress in compression: 20 MPa
- **For Brass/Bronze:**
- Working stresses: 50 MPa

Note: These values are approximate and vary depending on specific grades and conditions.

Design of Shafts

Shafts are fundamental in transmitting power and are subjected to torsion, bending, and combined stresses. Khurmi's data provides formulas and tables to determine the appropriate shaft size.

Basic Shaft Design Formulae

- **Torsional Shearing Stress:** $\tau = \frac{16 T}{\pi d^3}$
- **Flexural Bending Stress:** $\sigma_b = \frac{32 M}{\pi d^3}$

Shaft Diameter Calculation

To determine the diameter (d) of a shaft transmitting torque (T) with allowable shear stress (τ_{allow}) :

$$d = \sqrt[3]{\frac{16 T}{\pi \tau_{allow}}}$$

Similarly, for bending:

$$d = \sqrt[3]{\frac{32 M}{\pi \sigma_{allow}}}$$

Khurmi recommends choosing the larger diameter obtained from torsion and bending calculations to ensure safety.

Design Data for Keys and Couplings

Keys and couplings are essential for connecting shafts to machines and transmitting power.

Key Design Data

- **Key Length:** Usually 1.5 to 2 times the key width.
- **Key Width (w):**
 - For small shafts (
 - For larger shafts (> 30 mm): 10 mm or more
- **Key Thickness (t):** Typically 0.25 to 0.33 times the width.

Coupling Data

- **Types of Couplings:** Rigid, flexible, hydraulic, etc.
- **Design Considerations:** Power transmitted, misalignment allowance, ease of assembly.
- **Power Transmission Capacity:**
 - For rigid couplings: $P = \frac{2 \pi N T}{60}$

Design of Beams and Columns

Structural components like beams and columns are designed based on loadings and stability criteria.

Beam Design Data

- **Maximum Bending Moment (M):** Calculated based on loadings and span.
- **Section Modulus (Z):** $Z = \frac{M}{\sigma_{allow}}$
- **Section Dimensions:** Use standard shapes (I-beams, channels, etc.) with a suitable section modulus.

Column Design Data

- **Buckling Load:** $P_{cr} = \frac{\pi^2 E I}{(K L)^2}$
- **Effective Length Factor (K):** Depends on end conditions (fixed, pinned, etc.).
- **Column Cross-Section:** Selected based on load and buckling considerations, using data from Khurmi tables.

Gear and Gear Tooth Data

Gear design is vital in power transmission systems.

Gear Tooth Dimensions

- **Module (m):** Defined as $m = \frac{d}{z}$, where d is pitch diameter, z is number of teeth.
- **Addendum (a):** Equal to module $a = m$.
- **Dedendum (b):** Usually 1.25 times the module, $b = 1.25m$.

Gear Tooth Strength

- Based on Lewis's equation and data tables in Khurmi's book for bending and contact stresses.
- Allowable bending stress and contact stress are used to determine gear size and material selection.

Friction and Lubrication Data

Proper lubrication reduces wear and heat generation.

Types of Lubricants

- Oil lubricants (mineral, synthetic)
- Greases
- Graphite and dry lubricants for special conditions

Friction Coefficients

- **Oil lubrication:** 0.05 to 0.1
- **Grease lubrication:** 0.1 to 0.2

Lubrication Considerations

- Select lubricant based on operating temperature and load.
