The radar handbook offers detailed insights into the physical principles, system design, and operational parameters that make radar an indispensable tool in modern science and industry.

Fundamental Principles of Radar

The operation of radar is based on several core concepts:

- **Electromagnetic Wave Propagation:** Radar systems emit electromagnetic waves that travel through the atmosphere, reflecting off objects and returning to the radar receiver.
- **Echo Detection:** The time delay between transmission and reception of the echo provides information about the target's distance.
- **Frequency and Wavelength:** Different radar systems operate at various frequencies, influencing their resolution, penetration, and range.
- **Signal Processing:** Advanced algorithms analyze received signals to extract target information, filter noise, and enhance detection capabilities.

Types of Radar Systems

Radar systems are classified based on their operational purpose, frequency bands, and deployment environment:

- **Pulse Radar:** Emits short pulses of radio energy and measures the time delay to determine range. Widely used in air traffic control and military applications.
- **Continuous Wave (CW) Radar:** Transmits a continuous signal, primarily used for measuring Doppler shifts to determine target velocity.
- **Frequency Modulated Continuous Wave (FMCW) Radar:** Combines features of pulse and CW radars, suitable for short-range applications like automotive collision avoidance.
