Programming Windows with MFC Second Edition is a comprehensive guide that has long served as a foundational resource for developers delving into Windows application development using the Microsoft Foundation Classes (MFC). This edition builds upon the first, offering enhanced insights, updated techniques, and expanded coverage tailored to the evolving Windows programming landscape. Whether you're a seasoned developer or a newcomer, understanding the core principles and advanced features of MFC is essential for creating robust, efficient, and user-friendly Windows applications.

Introduction to MFC and Its Significance

What is MFC?

The Microsoft Foundation Classes (MFC) is a set of C++ classes that encapsulate the Windows API, simplifying the process of creating Windows applications. MFC provides developers with a rich framework that handles common tasks such as window creation, message handling, dialog management, and more. Its primary goal is to reduce the complexity associated with direct Windows API programming, allowing developers to focus on application logic rather than low-level details.

The Role of "Programming Windows with MFC Second Edition"

This second edition serves as both a tutorial and a reference manual, guiding programmers through the intricacies of MFC programming. It emphasizes practical implementation, illustrating concepts with real-world examples, and introduces new features aligned with modern Windows development practices.

Core Concepts in MFC Programming

The MFC Architecture

MFC's architecture is built around several core components that facilitate Windows application development:

- Application Class (CWinApp): The entry point of an MFC application, managing initialization and running the message loop.
- Window Classes (CWnd and Derived Classes): Encapsulate Windows controls and windows, handling message routing and UI rendering.
- Document/View Architecture: Separates data management (Document) from its presentation (View), enabling clean, maintainable code.
- Message Maps: A mechanism that routes Windows messages to class member functions, central to event-driven programming.

Message Handling and Event-Driven Programming

In MFC, almost all interactions are driven by messages. The message map system maps Windows messages (like clicks, keystrokes, or system events) to class member functions. This design simplifies event handling and encourages organized code structure.

Building Blocks of an MFC Application

Step 1: Setting Up the Project

The second edition emphasizes using Visual Studio's integrated project templates, which generate boilerplate code for various application types, such as SDI (Single Document Interface), MDI (Multiple Document Interface), and dialog-based applications.

Step 2: Creating Windows and Controls

MFC provides classes for standard Windows controls:

- CFrameWnd: Main application window frame.
- CDialog: Dialog boxes for user input.
- CButton, CEdit, CListBox, etc.: Standard controls with MFC wrappers.

Step 3: Implementing Message Maps

Defining message maps involves macros like `BEGIN_MESSAGE_MAP``, `END_MESSAGE_MAP``,

and entries such as `ON_COMMAND`, `ON_WM_PAINT`, etc. These connect messages to handler functions, enabling responsive UI behavior.

Advanced Features Covered in the Second Edition

Document/View Architecture Enhancements

The second edition expands on how to implement and customize the document/view model, allowing developers to:

- Integrate multiple views of the same document.
