1. Defining Antenna Array Geometry

The first step in phased array radar simulation is setting up the antenna array geometry.

```
```matlab

% Define parameters

numElements = 16; % Number of antenna elements

elementSpacing = 0.5; % Wavelength units (e.g., meters if wavelength=1m)

% Generate element positions for a linear array

elementPositions = (0:numElements-1) * elementSpacing;
```

## 2. Calculating Array Factor

The array factor (AF) describes the radiation pattern of the antenna array, which is crucial for beam steering and pattern analysis.

```
```matlab

% Define angles for radiation pattern

theta = linspace(-pi/2, pi/2, 180); % -90 to 90 degrees

% Define steering angle

steeringAngleDeg = 30; % degrees

steeringAngleRad = deg2rad(steeringAngleDeg);

% Calculate phase shifts for steering

phaseShifts = -2 pi elementSpacing sin(theta) + steeringAngleRad;

% Compute array factor

```

```
AF = zeros(size(theta));

for n = 1:numElements

    AF = AF + exp(1j (phaseShifts (n-1)));

end

% Normalize and convert to dB

AF_norm = abs(AF) / max(abs(AF));

AF_dB = 20log10(AF_norm);

% Plot radiation pattern

figure;

plot(rad2deg(theta), AF_dB, 'LineWidth', 2);

xlabel('Angle (degrees)');

ylabel('Normalized Gain (dB)');

title(['Array Pattern Steered to ', num2str(steeringAngleDeg), '°']);

grid on;

```
```

This script computes and visualizes the radiation pattern for a linear array steered at a specified angle.

### 3. Beamforming Algorithms

Adaptive beamforming enhances the radar's ability to suppress interference and improve target detection.

Sample Capon Beamformer:

```
```matlab
```

```
% Simulate received signals

numSensors = 16;

numSnapshots = 200;

signalDirection = 20; % degrees

interferenceDirection = -15; % degrees

% Generate steering vectors

steeringVecSignal = exp(1j 2 pi elementSpacing (0:numSensors-1)' sin(deg2rad(signalDirection)));

steeringVecInterf = exp(1j 2 pi elementSpacing (0:numSensors-1)'
sin(deg2rad(interferenceDirection)));

% Generate signals

signal = exp(1j 2 pi rand(1, numSnapshots));

interference = 0.8 exp(1j 2 pi rand(1, numSnapshots));

% Received data matrix

X = steeringVecSignal signal + steeringVecInterf interference + 0.1 randn(numSensors,
numSnapshots);

% Estimate covariance matrix

R = (X X') / numSnapshots;

% Define scan angles

scanAngles = -90:1:90;

beamPattern = zeros(size(scanAngles));

for idx = 1:length(scanAngles)

steerVec = exp(1j 2 pi elementSpacing (0:numSensors-1)' sin(deg2rad(scanAngles(idx))));
```

```
% Capon beamformer

P = 1 / (steerVec' (R \ steerVec));

beamPattern(idx) = 10log10(abs(P));

end

% Plot beam pattern

figure;

plot(scanAngles, beamPattern, 'LineWidth', 2);

xlabel('Angle (degrees)');

ylabel('Power (dB)');

title('Capon Beamformer Pattern');

grid on;

...

```

4. Simulating Target Detection

Simulating the radar's ability to detect a target involves generating received signals, applying beamforming, and analyzing the output.

```
```matlab

% Parameters

targetRange = 10; % arbitrary units

targetAmplitude = 1;

% Generate target signal

```

```
targetSignal = targetAmplitude exp(1j 2 pi rand(1, numSnapshots));

% Simulate received data

receivedData = steeringVecSignal targetSignal + 0.1 randn(numSensors, numSnapshots);

% Apply matched filter or beamforming

outputSignal = steeringVecSignal' receivedData / numSensors;

% Plot received signal amplitude

Introduction to Phased Array Radar and MATLAB's Role

Phased array radar systems use an array of antenna elements whose relative phases and amplitudes can be adjusted electronically to steer the beam direction without physically moving the antenna. This capability enables rapid beam steering, multiple simultaneous beams, and adaptive nulling, which are crucial for tracking fast-moving targets and avoiding interference.

Its extensive toolboxes, such as the Phased Array System Toolbox, facilitate the design, analysis, and testing of complex radar functionalities. Moreover, MATLAB's scripting environment simplifies the development of custom codes for array pattern synthesis, beamforming, clutter suppression, and target detection.

Fundamental Components of MATLAB Codes for Phased Array Radar

Designing effective MATLAB codes for phased array radar involves several key components, each representing a critical aspect of the system:

- Array Geometry and Element Pattern Definition

The foundation of any phased array simulation is defining the array geometry, such as linear, planar, or circular arrays. MATLAB scripts typically specify:

- Number of elements along each dimension.
- Element spacing, often set to half the wavelength ($\lambda/2$) for avoiding grating lobes.
- Element excitation patterns, including amplitude and phase distributions.

Example snippet:

```
``matlab

N = 16; % Number of elements

d = 0.5; % Element spacing in wavelengths

theta = 0; % Steering angle

% Element positions

element_positions = (0:N-1)d;

% Array factor calculation

AF = zeros(size(theta));

for n = 1:N

    AF = AF + exp(1j2pid(n-1)sin(theta));

end

``
```

- Array Pattern Synthesis

This step involves designing the array's radiation pattern to meet specific criteria, such as maximum gain in the desired direction and nulls in interference directions. MATLAB codes often include:

- Use of the Dolph-Chebyshev method for tapering and sidelobe control.
- Optimization routines for adaptive pattern shaping.

- Beamforming Algorithms

Beamforming is central to phased array radar, enabling dynamic steering and interference mitigation. MATLAB scripts implement various algorithms:

- Delay-and-sum beamforming: The simplest form, summing signals with appropriate delays.
- Adaptive algorithms: Minimum Variance Distortionless Response (MVDR), Least Mean Squares (LMS), and Recursive Least Squares (RLS) for adaptive nulling and sidelobe suppression.

Sample code for delay-and-sum:

```
```matlab

steering_vector = exp(1j*2*pi*d*(0:N-1)*sin(theta));

beamformed_signal = sum(received_signals .* conj(steering_vector), 1);

```
```

- Signal Processing and Detection

Post-beamforming, MATLAB codes perform matched filtering, Doppler processing, and detection algorithms such as CFAR (Constant False Alarm Rate). These routines are vital for identifying targets amidst clutter and noise.

- Simulation of Target and Clutter Scenarios

Simulating real-world conditions involves modeling target returns, clutter, interference, and noise. MATLAB's flexible environment allows users to generate synthetic data for testing algorithms under various scenarios.

Advanced MATLAB Codes for Phased Array Radar Applications

Adaptive Beamforming and Null Steering

One of the most powerful features of modern phased array radar is adaptive beamforming, which dynamically adjusts the array weights to maximize signal reception from a target while nullifying interference. MATLAB codes often implement algorithms like Capon's method, MVDR, or the Sample Matrix Inversion (SMI). These codes typically involve:

- Estimating the covariance matrix of received signals.
- Computing optimal weight vectors that minimize interference power.
- Applying these weights to steer the beam and create nulls.

An illustrative example:

```
```matlab

% Covariance matrix estimation

R = (1/M) (X X');

% MVDR weights calculation

w = (R \ steering_vector) / (steering_vector' / R steering_vector);

```
```

MIMO and Multiple-Beam Formations

Multiple-input multiple-output (MIMO) radar configurations extend the capabilities of traditional phased arrays by generating multiple beams simultaneously. MATLAB codes simulate MIMO transmission schemes, including orthogonal waveforms and spatial multiplexing, to enhance target detection and resolution.

Synthetic Aperture and Moving Target Indication (MTI)

Simulation codes also address advanced imaging techniques such as synthetic aperture radar (SAR) and moving target indication (MTI), which require precise phase coding and Doppler processing. MATLAB's matrix manipulation and signal processing functions streamline these complex simulations.

Practical Considerations in MATLAB Implementation

While MATLAB provides a robust platform, practical implementation of phased array radar codes demands attention to several factors:

- Computational efficiency: Large arrays and high-resolution simulations can be computationally intensive. Vectorized operations and pre-compiled functions help optimize performance.
- Numerical stability: Algorithms like covariance matrix inversion require well-conditioned matrices. Regularization techniques are often incorporated.
